Assessment and Validation:- Tender Methodology

In late 2002 the State Government of Victoria undertook the assessment of tenders received for the movement of individuals within both the judicial and police custody systems. This assessment was based upon the need to unify a number of previously separate outsourced transport contracts under a single unified contract.

AGILISTICS was tasked to assist in the assessment of the tender responses. Specifically this revolved around how the tenderer proposed to manage the day to day operation of the contract. As part of the assessment AGILISTICS looked at all the possible sources of information, the process triggers from the operational side of the contract and matched these against the proposal documents of the respective tenderers.

AGILISTICS were able to complete this task in the time allotted and within the budget allocated. AGIISTICS were also able to offer a complete path to be followed post contract award. The AGILISTICS assessment was based upon the standard AGILISTICS approach which involved current process definition, future process requirements and assessment of proposed software platforms via the AGILISTICS data base.

This approach offered the Victorian State Government insight and validation of the tender process for the contract. It also allowed for a clear decision to be made based upon the tender requirements for both process and software compliance.

...AGILISTICS not only completed the task required within the defined scope but also worked on important issues beyond the define bounds of the task. The AGILISTICS approach was hands on, practical and well grounded.
