

āgilišticš, vbl. phs.- the ability to develop and implement agile logistics solutions tailored to a specific clients need. (aust) 2002

Clothing Manufacture

In late 2002 a prominent Australian Clothing Group undertook a major review of their existing national transport arrangements. AGILISTICS were asked to assist in this process by coordinating standard transport data from the five divisions within the group.

The task involved extensive data modelling to verify the potential savings from changing transport providers. With a distribution network consisting of 9 despatch points and product shipped to individuals both locally and internationally the analysis was exceptionally complex. Analysis included modelling the current rates and movements against the proposed rates and distribution method.

AGILITSICS was able to provide detailed financial and distribution modelling to support the change based upon complex rate structures and time frames. This modelling allowed the client to assess the immediate impact of the transportation change as well as enter into some detailed scenario modelling.

With the modelling completed the client was able to comfortably accept the change proposed by the prospective carrier. To date the changes have delivered the savings and improvement in customer service identified by AGILISTICS in its analysis.

Agile ▶ Integrated ▶ Executable ▶ Supply Chain Solutions
